Smarter. Greener. Together.

Enjoy Your Energy Freedom

Unstable energy supply and pricing is a genuine concern for the home owner today!

Installing the right solar solution can deliver the confidence and peace of mind you require to enjoy life without worrying about the increasing costs and blackouts.

Product Overview

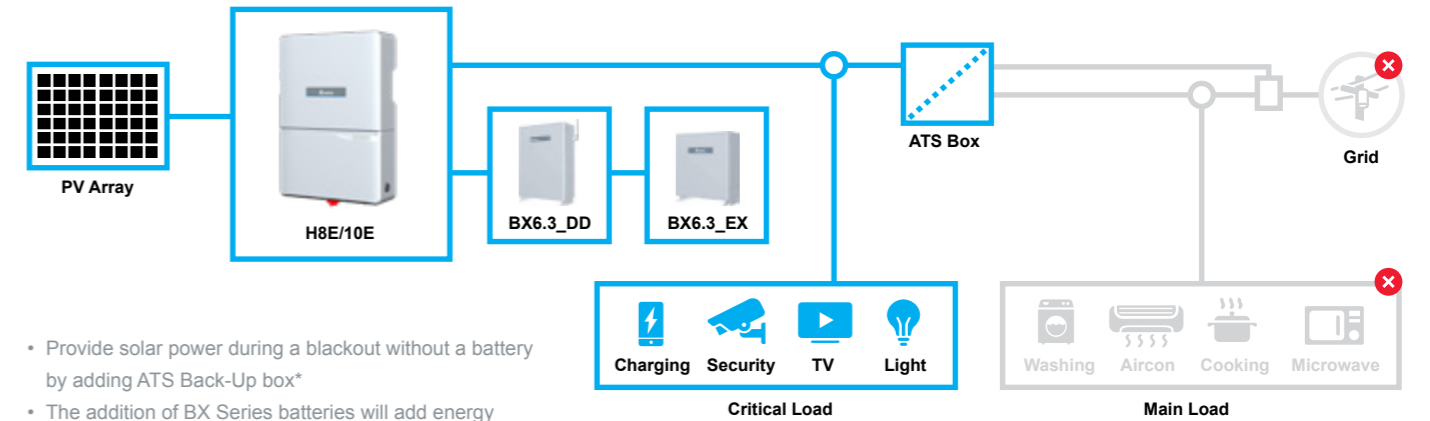

The IP65 Delta H8E and H10E inverters have 98.0% max efficiency and are packed full of features specifically designed for the Australian household.

We put full visibility of your home's energy status in your hands with the Delta app allowing you to make the right choices on how best to consume energy.

Features & Benefits

- Delta's H8E and H10E inverters will look amazing on your home thanks to the rear cable entry.
- External convection cooling eliminates dependency on external fans and greatly reduced moving parts as well as noise.
- The ONLY single phase inverter to include four independent trackers allowing 100% focus on up to 4 different orientations. This provides the benefit of being able to independently monitor the performance of each orientation.
- OTA (Over The Air) Updates will ensure your inverter is kept up to date with Delta's latest improvements as they become available.
- Compatible with Delta's upcoming BX6.3DD Battery, making it super convenient, simple and easy to store your daytime excess energy for later use.
- Get solar power during a blackout even without a battery by installing the H8E/H10E in conjunction with the upcoming Delta ATS. Want back-up power during night-time? Simply add a BX6.3DD or BX6.3AC to the ATS.

Hybrid Solar Back-up

- Provide solar power during a blackout without a battery by adding ATS Back-Up box*
- The addition of BX Series batteries will add energy storage and backup at night

Hybrid Solar & Energy Storage

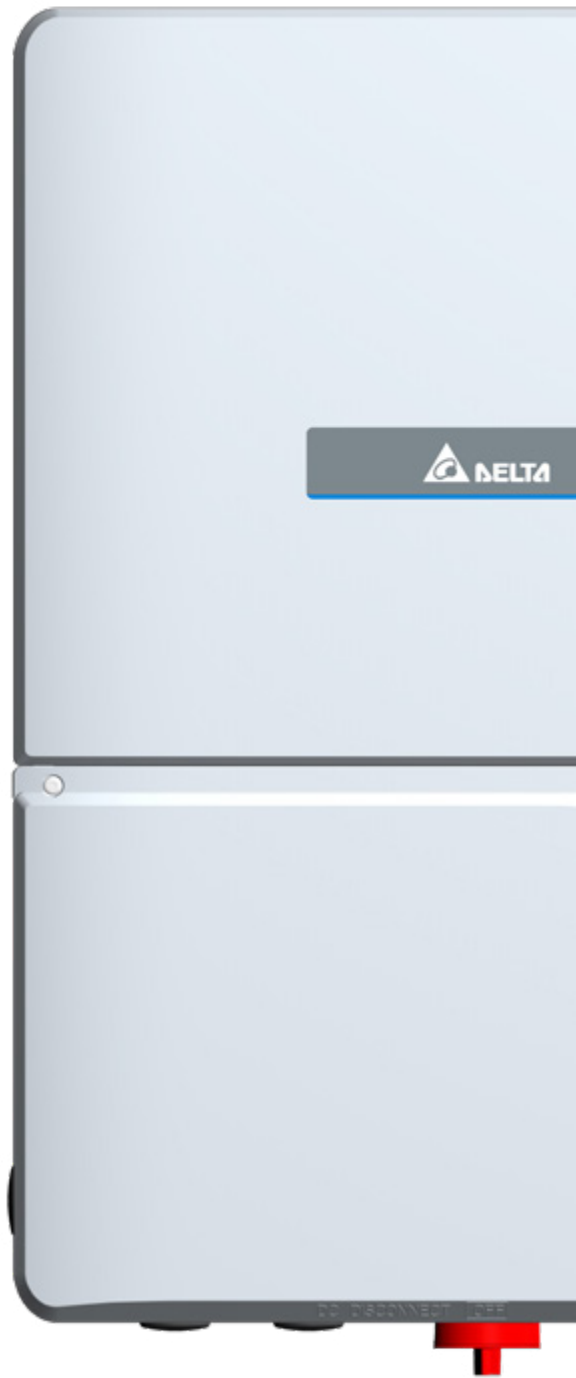

- Plug-and-play with DC-Coupled battery
- Battery can be extended to have a greater capacity
- Gain access to the battery during blackout by installing the ATS box

Smart Monitoring

- Utilise your solar perfectly and see exactly how much you're generating, consuming and sending to the grid with fulltime monitoring available LIVE online.
- If there's no Wi-Fi you can directly connect your smart device to the inverter for real-time data. No need to miss out.
